0.1 Modules in Python

In Python you have the possibility to pack code into modules, which you can then use in different places.

The file `hello.py` consists of the following content:

```python
# hello.py

def world():
    print("Hello World")

def mars():
    print("Hello Mars")
```

How can we integrate this file now?

```python
In [1]: import hello

        hello.world()
        hello.mars()
Hello World
Hello Mars

In [2]: from hello import world, mars

        world()
        mars()
Hello World
Hello Mars

In [3]: from hello import *

        world()
        mars()
Hello World
Hello Mars
```
